

Oral Surgery

Lecture 2

Case sheet part two

Clinical Examination

Careful history taking should be followed by
a **thorough** and **systematic** clinical
examination.

First, the examiner will observe the patient's appearance, general health, and behavior, along with measuring the vital signs including pulse, breathing rate, body temperature, and blood pressure.

In dentistry the diagnostic instruments includes:

1.Dental mirror

2.Dental probe.

3.Tweezer.

Methods of Clinical Examination:

In Clinical practice, examination of patient involves FOUR routine procedures:

1. INSPECTION.
2. PALPATION.
3. PERCUSSION.
4. AUSCULTATION.

INSPECTION (VISUAL) :-

At the start of every examination you must begin by Looking at **patient as a whole** before looking at the region in question for signs that may provide clue for a diagnosis any changes in the color, or asymmetry of the face and sclera of the eyes, any growth, ulceration, Scar, Defect, Loss of tissue should be inspected by your eye.

PALPATION:-

Next use your fingertips to feel for tender spots , Lump , Fluctuant Swelling , & Mobile teeth . Palpation gives information about texture, dimension, consistency, Temperature & Functional Events

PALPATION

Bidigital
palpation

Bimanual
palpation

Bilateral
palpation

PROBING

PROBING: - Is the palpation with an instrument & is one of the most important diagnostic techniques used in Dentistry. The teeth are probed for caries with the dental probe & periodontal probe is used to measure the periodontal sulcus depth. Lacrimal probe used for examination of parotid & submandibular salivary gland ducts. Fistulous tracts can be probed with Gutta Percha points to determine the origin of the Fistula.

PERCUSSION: -

Is the technique of striking the tissue with fingers or an instrument (e.g. Handle of the mirror). The examiner **listens to the resulting sounds & observes the response of the patient.** Extra orally, percussion is often used to detect tenderness in the frontal and maxillary sinuses by tapping the finger tips against a finger placed over the sinuses. Intra orally, percussion is used to evaluate the teeth by tapping the teeth with mirror handle; this technique may induce pain in the area of inflammation from periodontal diseases or periapical abscess.

PERCUSSION

AUSCULATION-

Is the act or process of listening for sounds within the body.
e.g. Auscultation to the clicking in the Temporomandibular Joint (T.M.J.) by the use of stethoscope. Auscultation technique is rarely used in Dentistry.

AUSCULATION

Extra-oral Examination

Extra oral Examination

Objectives: -

1. To evaluate any general abnormalities & in particular those of the head & neck region.
2. To look for signs & symptoms of the patient that could influence diagnosis & treatment. This examination includes:

Extra oral Examination

*General examination of the patient including his Posture, Gait, Facial Form, Nutritional, Status, Habits, Speech, Skin, Hair, nail, & all exposed parts of the body.

Spider nevus in liver disease

Butterfly rash in Systemic Lupus Erythematosus

Extra oral Examination

Examination of head include T.M.J., Lymph Nodes (Submandibular, Sub mental, etc..), Salivary gland Parotid & Submandibular gland etc.), Bones of skull, Sinuses (Maxillary Sinus), ear, eyes, & peri oral tissues.

Anatomic Location of Lymph nodes

Submandibular Lymph nodes

Anatomic Location of Lymph nodes

Pre & Post Auricular Lymph nodes

Occipital Lymph nodes

Submandibular lymph nodes: Palpate along the body of the mandible

Submental lymph nodes: Palpate just posterior to the tip of the mandible

Extra oral Examination

Examination of neck include Thyroid gland, Lymph Nodes (Cervical node anterior & posterior) & other midline structures & muscle (The neck should be inspected for midline or lateral swelling, scar, or any inflammatory lesions palpated for Thyroid enlargement or Cervical lymph node enlargement).

Extra oral Examination

The T.M.J, palpated for any clicking or pain, & asking the patient to open and close the mouth to see if there is any limitation of opening (Trismus), or deviation of occlusion.

Palpation of TMJ

Lateral palpation

Fig. 6.5 Intra-auricular palpation to palpate the posterior aspect of the TMJ

Extra oral Examination

The eyes should be examined for Exophthalmos or proptosis, pallor of Conjunctiva may indicate Anemia. Sclera of the eye should be also examined; Yellow discoloration may indicate Hepatitis or Obstructive Jaundice (Liver Diseases).

Exophthalmos in
hyperthyroidism

Anemia

Angular cheilitis in patient with iron deficiency

Anemia

Pallor of the palmar creases in the patient's hand (**red arrow**) compared to the examiner's hand (**blue arrow**).

Pale

Normal

Jaundice

Intra-oral Examination

Intraoral Examination: -

Objectives

- 1.To detect soft tissue abnormalities.
- 2.To evaluate the status of teeth and other hard tissues.

Intraoral Examination: -

Intraoral examination consists of evaluation of the following areas in systematic ways: Lips, Labial & Buccal Mucosa, Muco-buccal folds, floor of the mouth, Tongue, Hard & Soft Palate, Oropharynx, Muscle of mastication (Lateral & Medial muscles), Teeth, Gingiva, Orifice of the ducts of the Parotid and Sub mandibular Glands.

Intraoral Examination: -

Intra oral examination should begin with the observation of the mouth for extent or deviation. The extent of the opening its averaging between 35 – 55 mm and usually described in terms of the of the width of the patient's fingers e.g. 3 or 4 fingers opening, then we look for the oral Hygiene weather is good, fair poor, or very poor.

Intraoral Examination: -

We use the mouth mirror to reflect or retract the cheek & the lips with good light, to evaluate the condition of the vestibules, floor of the mouth, ventral surface of the tongue avoid any overlooking of these hidden areas, also the opening of the salivary glands ducts examined for enlargement, redness, & discharge.

Intraoral Examination: -

The ventral, lateral, dorsal, aspects of the tongue should be examined for the presence or absence of papillae, fissuring, ulceration, growth, indurations, limitation in extraction, & lateral movement. Hard & soft tissue examined for swelling, ulcers, sinuses, & perforation.

Intraoral Examination: -

The gingiva is examined , the color & the size of interdental papillae, any cause of food impaction, the presence of calculus, sinuses or retained roots, pocket etc...

Examination of Periodontium

inspection

Palpation

Examination of Periodontium

probing

PERCUSSION

Intraoral Examination: -

Teeth Examination: The presence, absence, appearance, mobility, retained roots, retained deciduous teeth, Malposed teeth, mobility of teeth classified as nil, marked or gross Attrition (Exposed dentin), Exposed roots, Carious Lesions, Vitality test (hot & cold application, Pulp tester, etc...).

Intraoral Examination: -

The presence, absence, appearance, The teeth might be percussed or probed with our instrument to see any tenderness or sensitivity of the teeth. Any edentulous area should be dried with a piece of cotton and examined for the presence of retained roots or discharging sinuses. Occlusion should be examined in closed and rest position the presence of open bite, type of occlusion (Neutro occlusion class I, or disto occlusion class II, or mesio occlusion class III).

Inspection

palpation

Teeth Examination

Probing

PERCUSSION

Investigations

Sometime the clinician determines that additional tests are needed to clarify some aspects of the diagnosis such tests include radiographic examination, Biopsy (Histological Study), Cytology, Aspiration, Clinical Laboratory studies.

Investigations

Radiographic examination: Is one of the special methods of examination which mostly used in the Oral Surgery. It provides information about hard & soft tissues that are hidden for eye which aid in diagnosis & to evaluate the progress of the disease. For example, Peri apical, occlusal, & extra oral views like lateral oblique of the Mandible radiograph. CT scan, MRI

•VITALITY TEST: -

1. Hot application (e.g. Hot instrument)
2. Cold application (e.g. Ethyl Chloride Application)
3. Electrical pulp Tester. Used to check the vitality or response of teeth.

Investigations

BIOPSY:- Small pieces of tissue taken from the lesion submitted to microscopical examination (Histopathology examination). Biopsy could be incisional or Excisional, Exfoliate Cytology. It is used to confirm the diagnosis of the lesion.

Investigations

•**ASPIRATION:** - the withdrawal of fluid from the lesion may aid in diagnosis. For example, aspiration of pus indicates an inflammatory process like abscess or in infected cyst. Aspiration of yellow fluid may indicate cystic lesion, aspiration of blood may indicate Vascular lesion like Hemangioma, etc.... Aspiration is one of the methods used to aspirate fluid from swelling for evaluation the nature of that swelling which may assist in Diagnosis.

Investigations

•LABORATORY TEST: - LIKE

1. bacteriological examination.
2. Hematological examination
3. Urine analysis (GUE)
4. Blood Chemistry & Serological examination.
5. Culture & sensitivity test.

All these tests or any one of these tests might be ordered **to aid as in confirming our Diagnosis**. So, collection of all information taken from the history & clinical examination & accessory information (Special tests) must be evaluated, analyzed to **reach the final Diagnosis**.

•PATIENT RECORD (MEDICAL) RECORD: -

It consists of: -

1. Case sheet.
2. All radiographs.
3. All investigation papers.
4. Referring papers.

•PATIENT RECORD (MEDICAL) RECORD: -

Objectives & Benefits: -

1. It assist in Diagnosis of the diseases.
2. For follow up & future checking.
3. For statistical analysis.
4. For studies & educations.
5. For Medico legal purposes.
